

# MICRO IN TOKYO●

The need of a micro home has increased in both demand and interest over the past few years, however it has been very common in the large metropolis in Japan. In Tokyo it is not uncommon to find an apartment under 18 square metres. With the spread of the covid virus, the home has developed into a space of refuge, a space occupied full time. A mindful space. As people have become more insular it has become important to have spaces where you can feel like one can breathe, with good lighting to boost well being and incorporate elements for indoor plants to improve internal air quality.

This green micro home focuses on verticality, to benefit from the small floor spaces in Tokyo, which can be transferred to any dense urban areas. The future of the city is small and green//

This Micro-house would be lofty to add the illusion of a larger space, as well as large windows to maintain a connection to the outside and mentally expand the internal space.

The Kitchen and dining space allows for a modest kitchen as well as pull out furniture and sofa that can be used for when guests are over, for mealtime or work.

Providing different floors for different uses allows for the compartmentalisation of the space, allowing for residence to separate their areas and prevent a feeling of claustrophobia.
